Aqueous glycine  
Sugars-water interaction

**Abstract** Density,  $\rho$ ; viscosity,  $\eta$ ; and refractive index,  $n_D^2$  of glucose, sucrose, and raffinose have been measured at 0.05 M aqueous glycine at 290.15, 303.15, 308.15, and 313.15 K. From these experimental data, apparent molar volumes,  $V_{app}$ ; apparent specific volumes,  $V_{app}^*$  as a function of the concentration of solutes, the osmotic pressure, molar volume,  $P_v^*$ ; transfer volume,  $\delta V$  from water to aqueous solution were calculated, and standard enthalpies of activation of viscosity flow were evaluated for glucose, sucrose, and raffinose in aqueous glycine solutions. Fickian diffusion coefficient,  $A$  and osmotic pressure,  $\pi$  were also calculated. The standard enthalpies of activation of viscosity flow,  $\Delta H^\phi$ ; standard entropy,  $\Delta S^\phi$ ; enthalpy,  $\Delta H^\phi$ , and entropy,  $\Delta S^\phi$  of activation of viscosity flow have been evaluated by using viscosity data. The molar refraction has been calculated by using measured refractive index data. Results have been explained in terms of solvation and solute-solute interactions.

**1. Introduction**

Sugars are the most abundant and diverse classes of organic molecules found in nature and their interaction with proteins, lipids, and other biomolecules including systems, fertilization, brain development, prevention of patho-

genesis and blood clotting (Salma, 2013). They serve as energy sources (Salma, 2013; Wang et al., 2013; Kuspid et al., 2003) and play a very crucial role in biological recognition phenomena and regulation of exchange of information between the cells and inter-cell interactions, cell death signal transduction, inflammatory processes, cancer metastasis, bacterial and viral infections, and many other physiological processes. The use of sugars in anticancer drugs (Salma, 2012; Carroll et al., 2006; Kaminski et al., 2012). Recently, Montecchini and co-workers (2012) have shown that the interaction of proteins with carbohydrates are of great interest for both technological and biomedical applications. Carbohydrates, especially in form of saccharides with proteins, play an important role in a wide range of biochemical processes. For example, the application of saccharides in bioprocessing. It is well-known that there are a lot of protein pharmaceuticals which are prepared by
